1. Matrix multiplication

1.1 [5 points] Write a program Main.f90 to read fortran_demo1/M.dat as the matrix M, and fortran demo1/N.dat as the matrix N.

```
Program Main
Implicit none
integer
                        :: u, i, j
real(4), dimension(5,3) :: M
real(4), dimension(3,5) :: N
real(4), dimension(5,5) :: MN
u = 50
open(unit=u, file='M.dat', status='old')
read(u,*) ((M(i,j),j=1,3), i=1,5)
close(u)
print *, 'M matrix'
do i = 1,5
    write(*,*) M(i,:)
enddo
open(unit=u, file='N.dat', status='old')
read(u,*) ((N(i,j),j=1,5),i=1,3)
close(u)
```

```
print *, 'M matrix'
do i = 1,5
    write(*,*) M(i,:)
enddo
open(unit=u, file='N.dat', status='old')
read(u,*) ((N(i,j),j=1,5), i=1,3)
close(u)
print *, 'N matrix'
do i = 1,3
    write(*,*) N(i,:)
enddo
call Matrix_multip(M,N,MN)
write(*,*) 'shape MN:', shape(MN)
open(unit=u, file='MN.dat', status='replace')
do i = 1,5
 write(u,'(f9.2)') MN(i,:)
```

```
do i = 1,3
    write(*,*) N(i,:)
enddo

call Matrix_multip(M,N,MN)

write(*,*) 'shape MN:', shape(MN)

open(unit=u, file='MN.dat', status='replace')
do i = 1,5
    write(u,'(f9.2)') MN(i,:)
enddo

close(u)

End Program Main
```

1.2 [5 points] Write a subroutine Matrix_multip.f90 to do matrix multiplication.

```
subroutine Matrix_multip(a,b,c)
implicit none

real(4), dimension(5,3), intent(in) :: a
real(4), dimension(3,5), intent(in) :: b
real(4), dimension(5,5), intent(out) :: c

= matmul(a, b)
end subroutine Matrix_multip
```

1.3 [5 points] Call the subroutine Matrix_multip() from Main.f90 to compute M*N; write the output to a new file MN.dat, values are in formats of f9.2.

```

                                                                         4.11000013
shape MN:
```

2. Calculate the Solar Elevation Angle

The solar elevation angle (SEA) is the angle between the imaginary horizontal plane on which you are standing and the sun in the sky. SEA is very important in deciding the inclination of solar panels, in both photovoltaics (PV) and thermal. The value of the SEA depends on the location on the Earth and the local date and time.

Please read this Solar Elevation Angle – Calculating Altitude of Sun and links therein for how to calculate SEA.

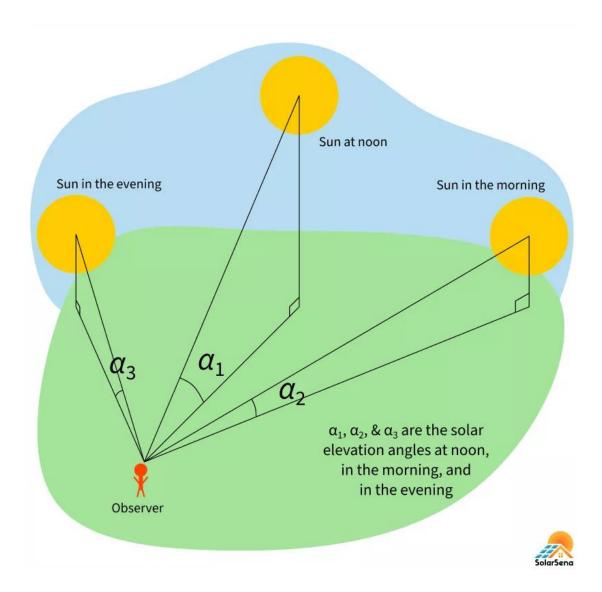

Figure source

2.1 [5 points] Write a module <code>Declination_angle</code> that calculates the *declination angle* on a given date.

[**Hint:** using the "Better formula" from Solar Declination Angle & How to Calculate it]

2.2 [10 points] Write a module Solar_hour_angle that calculates the solar hour angle in a given location for a given date and time.

[Hint: using the formulas from Solar Hour Angle & How to Calculate it]

```
end MODULE Solar_hour_angle_module
```

2.3 [5 points] Write a main program (Solar_elevation_angle.f90) that uses module Declination_angle and Solar_hour_angle to calculate and print the SEA in a given location for a given date and time.

```
Program Solar_elevation_angle
    USE Declination angle module
    USE Solar hour angle module
    implicit none
    real(8), parameter :: pi = 3.1415926536
    real(8) :: lat, lon, TZ, LST, h, angle, SEA, toarc
    integer :: days,year,month,day
    integer,dimension(12) :: month_array,month_leap array
    month array=(/31,28,31,30,31,30,31,30,31,30,31/)
    month_leap_array=(/31,29,31,30,31,30,31,30,31,30,31/)
    toarc = pi / 180
    lat = 22.542883
    lon = 114.062996
    TZ = 8.0
    LST = 10.53333
    year = 2021
    month = 12
    day = 31
```

2.4 [5 points] Create a library (libsea.a) that

contains Declination_angle.o and Solar_hour_angle.o. Compile Solar_elevation_angle.f90 using libsea.a. Print the SEA for Shenzhen (22.542883N, 114.062996E) at 10:32 (Beijing time; UTC+8) on 2021-12-31.

```
[ese-tianxj@login02 ~]$ nano Declination_angle.f90
